Using the Markowitz model we are able to calculate the optimal portfolios at each risk level. However, optimizing for the Sharpe Ratio, allowed an investor to identify the portfolio that had the best risk-adjusted returns, relative to a risk-free asset. This optimization can be described as: $\max_{\mathbf{p}} \frac{R_p - R_{rf}}{\sigma_p}$ s.t.: $\sum_{i=1}^N w_i = 1$, $0 \leq w_i \leq 1$; 8 / Page 9

Abstract. In this paper, we provide a closed-form solution to an optimal portfolio execution problem with stochastic price impact and stochastic net demand pressure. Specifically, each trade of an investor has temporary and permanent price impacts, both of which are driven by a continuous-time Markov chain; whereas the net demand pressure from other investors is modelled by an Ornstein—Uhlenbeck process.

Under the framework of derivative pricing and dynamic portfolio optimization, Wishart process is a multivariate stochastic volatility model concerned by many scholars (,,,). Although the Wishart process captures several important stylized facts, it is still not simple enough to be used for estimation and simulation.

In this paper, first we study a general stochastic volatility market model for which an explicit candidate solution to the problem of maximizing utility function of terminal wealth is obtained. Applying this result, we present a complete solution for the Heston model which is a particular case of the general model. A verification result and a martingale representation of the solution are ...

Merton's portfolio problem is a well known problem in continuous-time finance and in particular intertemporal portfolio choice. An investor must choose how much to consume and must allocate his wealth between stocks and a risk-free asset so as to maximize expected utility. The problem was formulated and solved by Robert C. Merton in 1969 both for finite lifetimes and for the infinite case.

Portfolio optimization is the process of selecting the best portfolio (asset distribution), out of the set of all portfolios being considered, according to some objective. The objective typically maximizes factors such as expected return, and minimizes costs like financial risk.

A Stochastic Volatility Model and Optimal Portfolio Selection

By describing the actions of the investor via the portfolio process (i.e. the percentages of wealth invested in the different securities) Merton was able to reduce the portfolio problem to a control problem which could be solved by using standard stochastic control methodology. 1 A drawback of Merton's model, however, is the assumption of ...

In order to tackle the problem of how investors in financial markets allocate wealth to stochastic interest rate governed by a nested stochastic differential equations (SDEs), this paper employs the Nash equilibrium theory of the subgame perfect equilibrium strategy and propose an extended Hamilton-Jacobi-Bellman (HJB) equation to analyses the optimal control over the financial system ...
